

Service conditions

The use of the platform services is considered a collaboration. Depending on the mode of the collaboration and service conditions agreed on, the users can be partly or fully charged for the costs of using consumables, equipment, and technical assistance. SDU 4P expects to co-authorize scientific publications resulting from work using the platform services/purified protein.

Based on written or oral descriptions we will assess all protein expression and purification projects to ensure that the tasks are feasible and realistic to complete within a reasonable time. Thus, all projects must be approved by the SDU 4P before researchers can start using the platform services. We recommend that the gene encoding the target protein has been cloned before contacting the SDU 4P. However, we advise and assist in the cloning if relevant.

Contact us to learn more about the services we offer, modes of collaboration, or the specific service conditions. We welcome and anticipate the collaboration of scientists from other departments, universities, hospitals, and companies.
