

*Title:*

*Delayed Breast Reconstruction with Skin Flap from the Back*

*Sekundær brystrekonstruktion med hudlap fra ryggen*

Mikkel Børsen-Koch, M.D. and ph.d. student

The purpose of this study is to examine different outcomes of breast reconstruction in women who are treated for breast cancer with mastectomy and subsequently have delayed breast reconstruction by one of two different surgical techniques both of which are based on the use of a pedicled tissue flap from the patient's back.

The main objective of the study is to establish whether one of these techniques may result in a superior outcome and thus should be recommended as first choice treatment rather than the other.
