Introduction	The model	Conclusion
● 0000	0000 00 0 000	

• Broad question:

Can energy be used to understand economic systems?

Introduction	The model	Conclusion
0000		

• On the relation between energetic and economic variables

- Labor (Mountain, 1985) and capital (Tatom, 1979)
- Market prices (Liu et al., 2008)
- Income (Asafu-Adjaye, 2000) and GDP (Lee, 2005, 2006)
- Macro variables (Kilian, 2008; He et al., 2010)
- Remarkable lack of consensus

Introduction 00●00	How to do this? 0000	The model 0000 00	Conclusion 000

- Within the neoclassical doctrine
 - Energy consumption and growth (Lee, 2006; Stern, 2000)
 - Oil price shocks (Cologni & Manera, 2008; Kilian, 2008)
- Between neoclassics and biophysical economists
 - Energy is fundamental (Podolinski, 1880; Costanza, 1980; Ayres, 1998)
 - ...it is not (Berndt, 1980; Bohi, 1989; Denison, 1985)

Introduction 000●0	How to do this? 0000	The model 0000 00 00 000	Conclusion 000

- What has been done using neoclassical procedures?
 - Energy markets (Atkinson & Halvorsen, 1976; Bhattacharyya, 2011)
 - Energy efficiency (Levinson, 1978; Palmer & Walls, 2015)
 - Greenhouse gas emissions (Murray et al., 2014; Acemoglu et al., 2016)

Introduction 000●0	How to do this? 0000	The model 0000 00 00 000	Conclusion 000

- What has been done using neoclassical procedures?
 - Energy markets (Atkinson & Halvorsen, 1976; Bhattacharyya, 2011)
 - Energy efficiency (Levinson, 1978; Palmer & Walls, 2015)
 - Greenhouse gas emissions (Murray et al., 2014; Acemoglu et al., 2016)
- What has been done using energy principles?
 - Early work (Podolinsky, 1880; Soddy, 1933; Cottrell, 1955; GR, 1971)
 - Theories of value (Costanza, 1980; Alessio, 1981; Patterson, 1998)
 - Biophysical and ecological economics (Cleveland et al., 1984; Odum, 1996; Ayres, 1998; Gillett, 2006; Hall & Klitgaard, 2012)

Introduction	The model	Conclusion
00000		

- What has not been done?
 - Integrate energy principles with neoclassical procedures in a *comprehensive, systematic* way

Introduction 00000	How to do this? 000€	The model 0000 00 00 000	Conclusion 000

How to do this?

• Energy and power as the fundamental "scarce means"

"Economics is the science which studies human behaviour as a relationship between ends gaps and scarce means energy and power which have alternative uses."

(Modified) Robins, 1932

Introduction 00000	How to do this? 0000	The model •000 00 00	Conclusion 000
The supply and have			

Energy expenditure minimization

$$\begin{array}{ll} \min_{\boldsymbol{x}_{\boldsymbol{k}}} & G_{\boldsymbol{k}} = \boldsymbol{\omega}_{\boldsymbol{k}} \boldsymbol{x}_{\boldsymbol{k}} \\ \text{s.t.} & f(\boldsymbol{x}_{\boldsymbol{k}}) \geq \overline{Q_{\boldsymbol{k}}} \\ & x_{l} \leq \overline{x_{l}} \qquad \forall l = 1, \dots, L \end{array}$$

- G_k = Total energy (direct plus indirect) spent on good k
- $\omega_{\pmb{k}} =$ Energy dissipated at full workload per prime mover
- $x_k =$ Quantity of prime movers used on k
- $f(\mathbf{x}_k) = \text{Production function relating } \mathbf{x}_k$ to Q_k

Introduction 00000	How to do this? 0000	The model ◦●◦◦ ◦ ◦ ◦ ◦ ◦ ◦ ◦	Conclusion 000
The second second states			

Energy expenditure minimization

$$\begin{array}{ll} \min\limits_{\mathbf{x}_{k}} & G_{k} = \boldsymbol{\omega}_{k} \mathbf{x}_{k} \\ \text{s.t.} & f(\mathbf{x}_{k}) \geq \overline{Q_{k}} \\ & x_{l} \leq \overline{x_{l}} \qquad \forall l = 1, \dots, L \end{array}$$

$$\frac{\partial x_1^*}{\partial \omega_1} = \frac{-f_1^2}{|H|} < 0$$

$$\frac{\partial x_2^*}{\partial \omega_1} = \frac{f_1 f_2}{|H|} > 0$$

$$\frac{\partial G_k}{\partial Q_k} = \gamma_k$$

Desires, matter, and energy

Introduction 00000	How to do this? 0000	The model 00●0 00 00	Conclusion 000

Energy surplus maximization

$$\begin{aligned} \delta_{i} \mathbf{Q}_{i} - \mathbf{G}_{i} \mathbf{i} : & \frac{\partial E_{i}}{\partial Q_{i}} \implies \delta_{i} = \gamma_{i} \quad \forall i = 1, \dots, m \\ \delta_{i} \mathbf{f}(\mathbf{x}_{i}) - \omega_{i} \mathbf{x}_{i} : & \frac{\partial E_{i}}{\partial \mathbf{x}_{l}} \implies \delta_{i} \mathbf{f}_{i} = m \omega_{l} \quad \forall l = 1, \dots, L \end{aligned}$$

- E = Total energy surplus
- $I = \delta_i Q_i = \delta_i f(x_i) = \text{Energy income}$
- $\delta_i = \text{Energy content of energy good } i$

Introduction 00000	How to do this? 0000	The model 000● 00 0000	Conclusion 000

Energy surplus maximization

$$\begin{aligned} \delta_{i} \mathbf{Q}_{i} - \mathbf{G}_{i} : & \frac{\partial E_{i}}{\partial Q_{i}} \implies \delta_{i} = \gamma_{i} \quad \forall i = 1, \dots, m \\ \delta_{i} \mathbf{f}(\mathbf{x}_{i}) - \omega_{i} \mathbf{x}_{i} : & \frac{\partial E_{i}}{\partial \mathbf{x}_{i}} \implies \delta_{i} \mathbf{f}_{i} = m \omega_{i} \quad \forall l = 1, \dots, L \end{aligned}$$

- More refutable hypothesis
 - Own and crossed substitution effects of prime movers
 - Energy content effect on prime movers and quantity

 - Crossed-embodied energy effects of energy goods
 - 'Marginal utility of energy' embodied energy effect

Introduction 00000	How to do this? 0000	The model	Conclusion 000
Equilibrium			

Long-run (no power constraints)

Setting production equal to consumption, long-run eq. es characterized by:

•
$$\delta_i = \gamma_i \quad \forall i$$

• $\delta'_i = \frac{U_j}{\lambda} \quad \forall j$

Together with tangency conditions, this guarantees Pareto efficiency

Introduction 00000	How to do this? 0000	The model ○○○○ ○○ ●○○	Conclusion 000
Short-run equilibrium			

Short-run (active power constraints)

Assume $x_1^* > \bar{x}_1$

•
$$\delta_i = \gamma_i + \phi_1 \cdot f^{-1}(Q_i, x_{i,-1}) \quad \forall i$$

\rightarrow The equimarginal principle no longer holds

Where:

- $\phi_1 = Marginal$ energy surplus of prime mover 1
- $f^{-1}(\cdot) =$ Marginal technical requirements of production function
- $x_{i,-1}$ = all prime movers used to produce *i* except 1
