

Life with dementia

“Life with dementia” is a cross-cutting Citizen Science project between SDU and Demenskliv (OUH). Dementia is a chronic disease. It is estimated that up to 87,000 citizens and their relatives live with dementia in various degrees. The number of people with dementia or people affected by dementia must be expected to increase as life expectancy increases, which is a challenge for municipalities and the healthcare system – especially in rural districts. Read more about the project.

Article:

“Life with dementia” is a cross-cutting Citizen Science project between SDU (SUND, HUM, SAMF, NAT) and Demenskliv (OUH).

Dementia is a chronic disease. It is estimated that up to 87,000 citizens and their relatives live with dementia in various degrees. The number of people with dementia or people affected by dementia must be expected to increase as life expectancy increases, which is a challenge for municipalities and the healthcare system, especially in rural districts.

In line with the UN’s global goal number 3 it is extremely relevant for CLF to be a part of this research area from a rural district perspective. SDU has granted 1.3 million kr. to formulate and seek funds to a larger “citizen science” research effort, which is based on what we can learn from those who are living with dementia in their everyday lives. There are already some municipalities who have expressed an interest in being a partner in the project.
