

The Nordic Twin Cancer Study

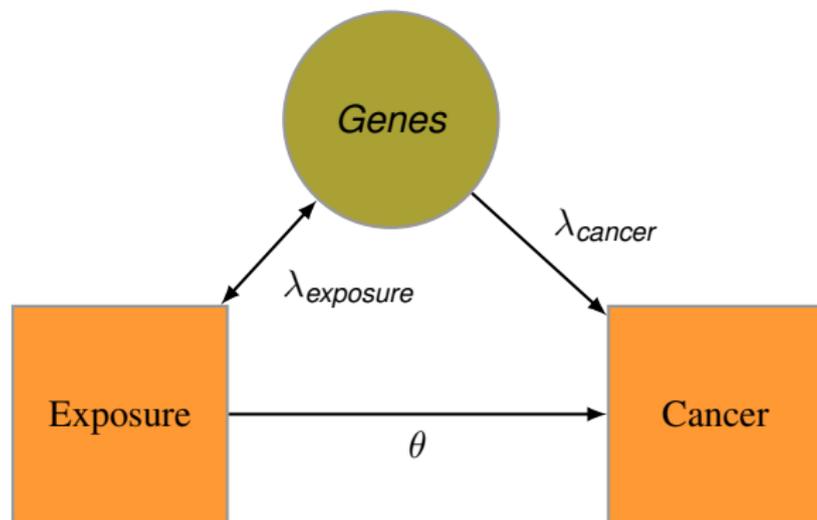

Dept. of Epidemiology and Biostatistics, SDU

Analysis of Twin Data in Health Science

17. maj 2018

Nordic Twin Cancer Study (2017)

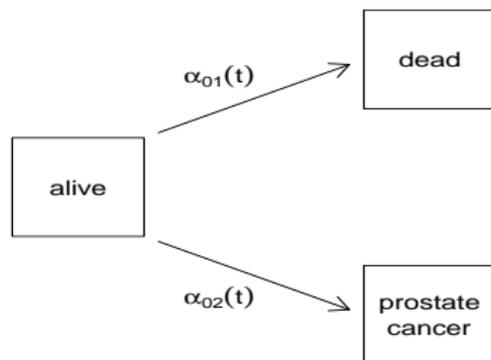

- (Exposures): Direct effect?
- (Genes): Genetic effect present and magnitude?
- (Interaction): Indication of genetic **modification** of exposure effect?

The Nordic Twin Cancer Study

HARVARD
SCHOOL OF PUBLIC HEALTH

	Denmark	Finland	Norway	Sweden	Total
Birth	1870-2004	1880-1957	1895-1979	1886-2008	
Cancer since	1943	1953	1953	1958	
Twins	110,482	24,438	26,470	136,822	298,212

Heredity of Cancer Elucidated by a Study of Unselected Twins

Bent Harvald, MD, and Mogens Hauge, MD, Copenhagen, Denmark

- **1963**: ~15.000 Danish twins, first study, less to conclude (JAMA).
- **2000**: ~90.000 Landmark paper, but wrong methodology (NEJM).
- **2016**: ~300.000 Most comprehensive of familial risks ever (JAMA).

Original Investigation

Familial Risk and Heritability of Cancer Among Twins in Nordic Countries

Lorelei A. Mucci, ScD, MPH; Jacob B. Hjelmborg, PhD; Jennifer R. Harris, PhD; Kamila Czene, PhD; David J. Havelick, ALM; Thomas Scheike, PhD; Rebecca E. Graff, ScD; Klaus Holst, PhD; Sören Möller, PhD; Robert H. Unger, BS; Christina McIntosh, SM; Elizabeth Nuttall, BA; Ingunn Brandt, MSc; Kathryn L. Penney, ScD; Mikael Hartman, MD, PhD; Peter Kraft, PhD; Giovanni Parmigiani, PhD; Kaare Christensen, MD, PhD; Markku Koskenvuo, MD, PhD; Niels V. Holm, MD, PhD; Kauko Heikkilä, PhLic; Eero Pukkala, PhD; Axel Skytthe, PhD; Hans-Olov Adami, MD, PhD; Jaakko Kaprio, MD; for the Nordic Twin Study of Cancer (NorTwinCan) Collaboration

Cancer site	Cumulative risk ¹ (%)	N Twin pairs concordant/ discordant		Familial risk ² (95% CI) – MZ twins	Familial risk (95% CI) – DZ twi
		MZ	DZ		
Overall cancer	32.4%	1383/5887	1933/11461	45.9% (44.1%-47.7%)	37.1% (35.7-38.4)
Head and neck ³	0.8%	5/191	6/361	6.0% (2.4-14.4%)	5.1% (2.2-11.3%)
Esophagus	0.4%	0/87	0/183	--	--
Stomach	1.6%	14/338	15/648	6.8% (3.9-11.4%)	4.4% (2.6-7.3%)
Small intestine	0.1%	0/32	0/59	--	--
Colon	2.9%	30/577	31/1156	10.9% (7.4-15.8%)	7.9% (5.4-11.4%)
Rectum and anus	1.9%	14/440	13/771	6.6% (3.7-11.4%)	5.8% (3.4-9.7%)
Liver	0.5%	0/124	2/208	--	--
Gallbladder, extrahepatic bile duct	0.5%	1/110	1/187	0.5% (0-4.7%)	0.3% (0-1.0%)
Pancreas	1.1%	4/234	6/508	4.3% (1.5-11.6%)	3.7% (1.5-8.6%)
Nose, sinuses	0.1%	0/21	0/36	--	--
Larynx	0.2%	2/53	1/113	8.4% (2.3-26.4%)	2.7% (1.1-6.1%)

Biostatistics - Methodology

- *Estimating heritability for cause specific mortality based on twin studies*; Scheike, Holst and Hjelmberg; *LIDA* (2013).
- *Estimating twin concordance for bivariate competing risks twin data*; Scheike, Holst and Hjelmberg; *Stat Med* (2014)
- *Measuring early or late dependence for bivariate lifetimes of twins* Scheike, Holst and Hjelmberg; *LIDA* (2014).
- *Estimating Twin Pair Concordance for Age of Onset* Scheike, T. H., Hjelmberg, J. B. and Holst, K. K.: *Behavior Genetics*. (2015)

R.A. Fisher (1890-1962)

- R.A. Fisher (1918): Biometrical Genetics.

Biometrical Genetics

XV.—The Correlation between Relatives on the Supposition of Mendelian Inheritance. By R. A. Fisher, B.A. Communicated by Professor J. ARTHUR THOMSON. (With Four Figures in Text.)

(MS. received June 15, 1918. Read July 9, 1918. Issued separately October 1, 1918.)

CONTENTS.

	PAGE		PAGE
1. The superposition of factors distributed independently	402	15. Homogeneity and multiple alleles, <i>scrophines</i>	416
2. Phase frequency in each array	402	16. Coupling	419
3. Parental regression	403	17. Theories of assortive correlation; ancestral correlations	419
4. Dominance deviations	403	18. Ancestral correlations (second and third theories)	421
5. Correlations for parents; genetic correlations	405	19. Numerical values of assortive correlation	421
6. Postnatal correlations	405	20. Fraternal correlation	422
7. Correlations for other relatives	406	21. Numerical values for environment and dominance ratios; analysis of variance	423
8. Epistasy	406	22. Other relatives	424
9. Assortive mating	410	23. Numerical values (third theory)	425
10. Frequency of phases	411	24. Comparison of results	427
11. Association of factors	411		
12. Conditions of equilibrium	412		

Model??

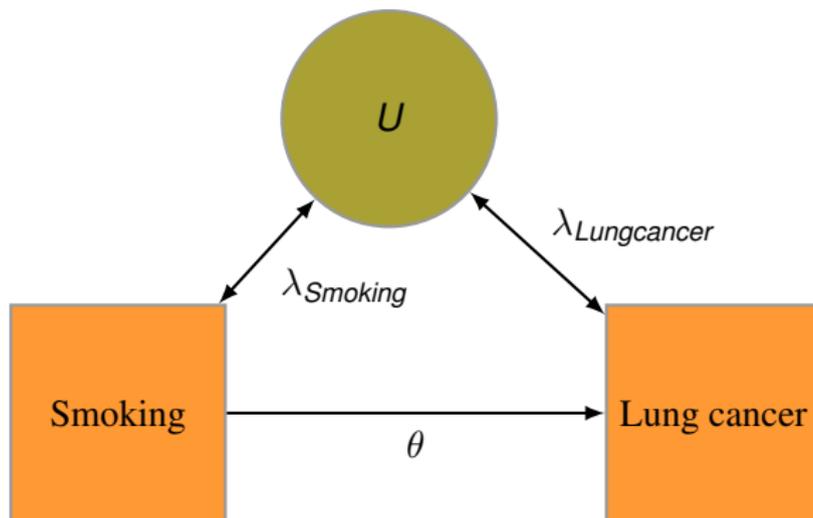

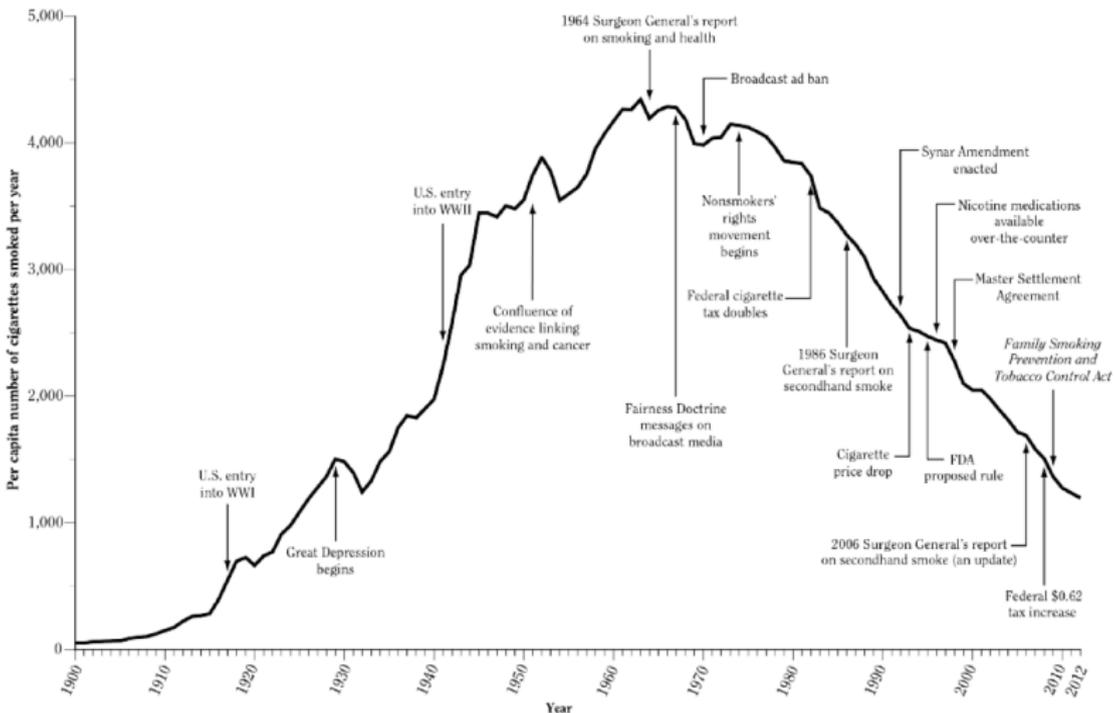

Figure 2.1 Adult* per capita cigarette consumption and major smoking and health events, United States, 1900–2012

*Adults ≥18 years of age as reported annually by the Census Bureau.

R.A. Fisher (1890-1962)

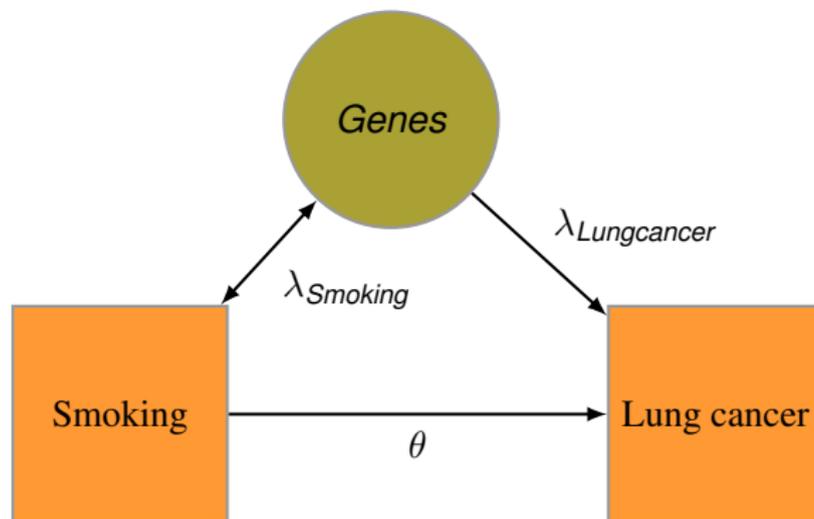

- (1918): Biometrical Genetics.
- (1935): Randomization negates the effect of confounders.
- (1950): 'correlation does not imply causation'.

Model by R.A.Fisher (1950)

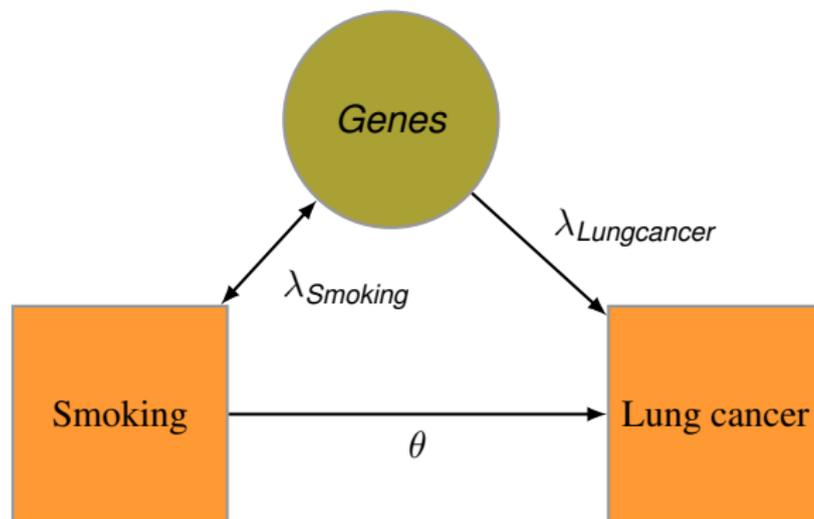

Nordic Twin Cancer Study (2017)

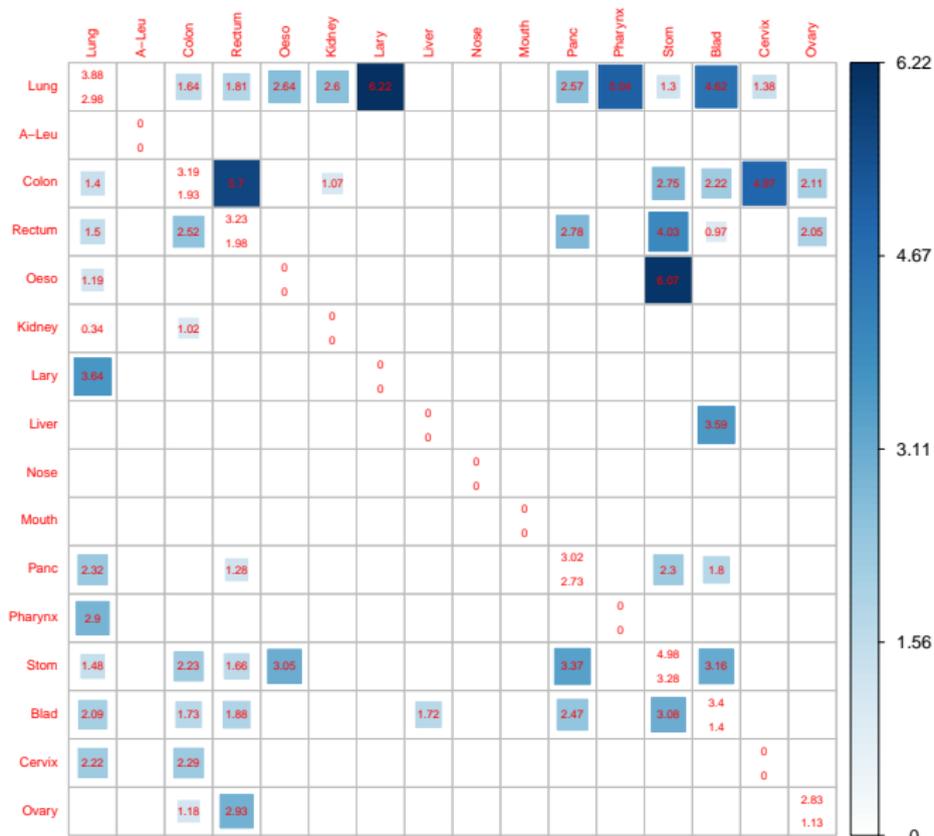

- (Smoking): Direct effect.
- (Genes): Genetic effect present and may be **mediated** through smoking.
- (Interaction): No indication of genetic **modification** of smoking effect.

Nordic Twin Cancer Study (2017)

- (Smoking): Direct effect.
- (Genes): Genetic effect present and may be **mediated** through smoking.
- (Interaction): No indication of genetic **modification** of smoking effect.

Relative recurrence Risks - Tobacco cancers

Peto Mack Hypothesis

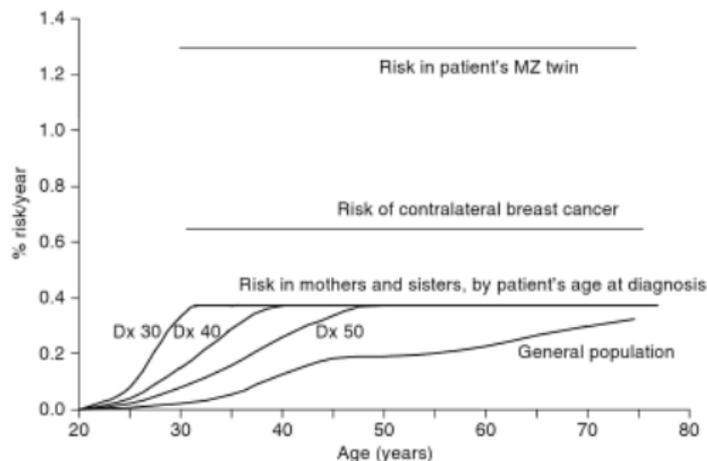

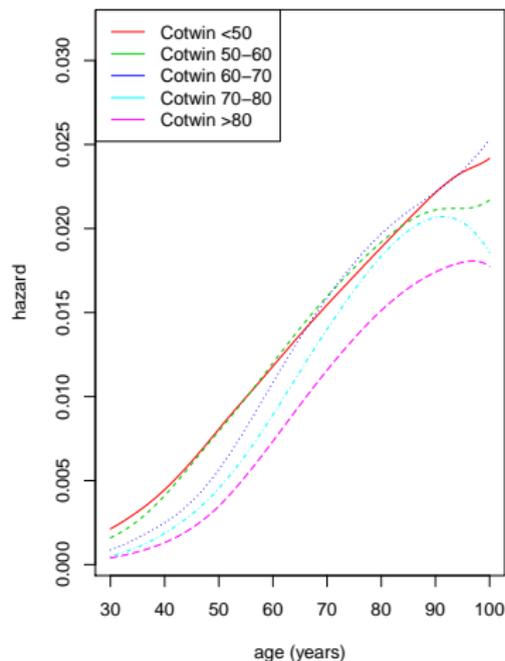

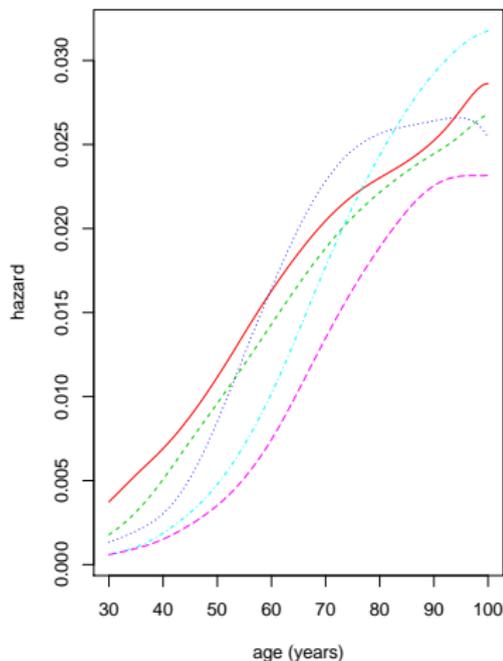

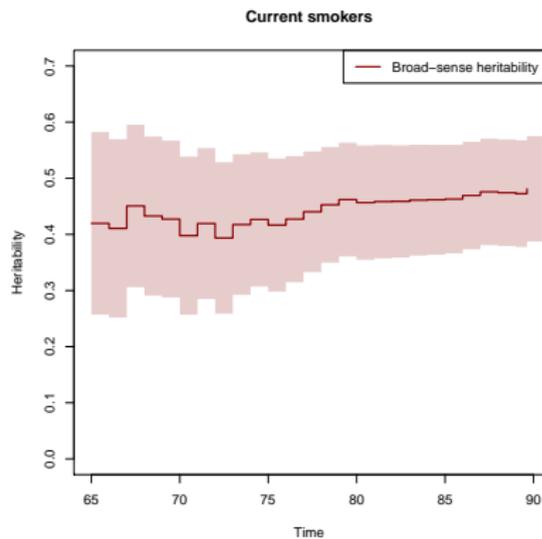

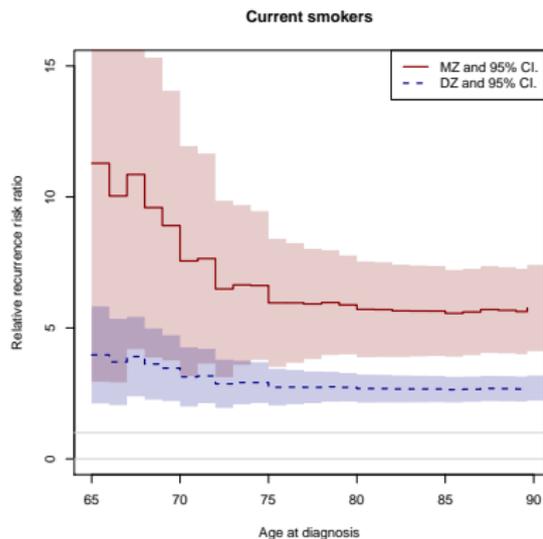

Figure 17.1 Incidence of breast cancer in the general population and in patient's relatives. Dx, age at diagnosis of breast cancer.

Peto Mack Hypothesis - All Cancer

Forecasting Cancer Incidence

- Constant force of cancer suggests Gompertz-law of incidence.
- How about forecasting lung cancer incidence given exposure and constant force of cancer?
